

SIRSI METALLISATOR

VALVOLE A PINZA E A MEMBRANA

PINCH AND DIAPHRAGM VALVES

SIRSI METALLISATOR

La Aziende Riunite SIRSI METALLISATOR S.p.A., è nata dalla fusione di due anonime, SIRSI e METALLISATOR, avvenuta il 28 Settembre 1955.

La SIRSI era stata costituita a Torino il 2 Aprile del 1927 con capitale di L. 1.150.000, rilevante per allora, diviso a metà tra i due soci fondatori: Leonardo Cerini, che fu il primo Presidente, e la SNIA VISCOSA, società prestigiosa fondata dal noto finanziere Riccardo Gualino, maggior produttrice di "rayon" in Italia e collegata con le grandi società inglesi ed americane del settore.

Leonardo Cerini venne citato in tutti i testi universitari del mondo industriale per il brevetto del recupero della soda caustica "di pressa" delle industrie del "rayon" o seta artificiale. Di questo cedette lo sfruttamento alla SIRSI. Per la produzione degli impianti furono create all'estero la Société Cerini di Parigi e la RACE Inc. in U.S.A.

La METALLISATOR ITALIANA S.A., fondata nel 1929 per diretta emanazione della METALLISATOR A.G. di Berlino, iniziò a produrre impianti per la metallizzazione a spruzzo a freddo che richiedeva la "sabbatura" di tutto ciò che si doveva metallizzare.

Gli impianti di sabbatura erano sino ad allora assolutamente sconosciuti in Italia. Si sviluppò quindi una notevole nuova impresa.

Ingresso Stabilimento Cerini - inizio secolo

Una straordinaria documentazione fotografica di questi anni dimostra l'alto livello tecnico raggiunto e le diversificazioni degli impianti assai complessi con elevati automatismi.

La METALLISATOR restò unica in Italia a produrre sabbatrici sino alla fine della seconda guerra.

Sin dal 1939 la SIRSI aveva iniziato lo studio di una valvola a pinza che si ispirava alla "pinzetta Hoffman", oggetto da laboratorio.

La fine della guerra segnò la ripresa di tutte le attività: la METALLISATOR iniziò la produzione di sabbatrici a turbina e la SIRSI mise a punto una serie di valvole a manicotto di cui si iniziò la produzione agli inizi degli anni '50.

Qui finisce la storia ed inizia una recente cronaca industriale di costante progredire e di successi della società.

Le sabbatrici a turbina della SIRSI METALLISATOR hanno partecipato all'evoluzione del settore per poi anticiparne i tempi e superarne i limiti ed hanno raggiunto i massimi di potenza, di portata e le maggiori produzioni in termini di tonnellate, numero di pezzi e metri quadri di superficie trattata nell'unità di tempo.

Le sabbatrici SIRSI METALLISATOR operano in tutto il mondo con soddisfazione della migliore clientela.

Vittorio Emanuele III con il dottor Leonardo Cerini in visita allo stabilimento

Le valvole SIRSI sono oggi impiegate oltre che in Italia, in tutti i Paesi dell'Europa comunitaria, nella Russia anche asiatica, lungo le coste mediterranee dell' Africa e nelle sue miniere del centro, del Medio Oriente, nel Sud-Est asiatico ed in Cina. Sono rinomate per la resistenza, la durata e l'affidabilità negli impieghi più rigorosi.

Il primo Presidente e fondatore, Visconte Leonardo Cerini di Castegnate, instancabile e combattivo imprenditore, cessò la Sua vita laboriosa nell' Ottobre del 1964. Alla presidenza fu nominato il figlio Livio. Il nipote del fondatore con il suo stesso nome, Leonardo Cerini, che si occupò subito attivamente della società, è oggi Consigliere Delegato e Direttore Generale.

SIRSI METALLISATOR

The business company "SIRSI METALLISATOR" was born from the merger of two anonymous undertakings SIRSI and METALLISATOR, which took place on 28th September 1955.

The SIRSI had been established in Turin on 2nd April 1927 with quite a relevant capital of 1.150.000 Lira, divided between the two promoters Leonardo Cerini and Snia Viscosa. The former became the first chairman of the SIRSI and the latter, the most famous Italian "rayon" producing manufacturer, founded by the well-known businessman Riccardo Gualino was in close business relations with important English and American companies in the same field. Leonardo Cerini, often quoted in university text books of economics and business, was the holder of a world renowned patent for "press" caustic soda recycling in the rayon artificial silk industries.

Leonardo Cerini granted SIRSI the rights for world usage of said patent. The société CERINI in Paris and The RACE Inc. in the USA were founded for the production of these plants.

The METALLISATOR ITALIANA S.p.A., founded in 1929 under the direct authorization of METALLISATOR A.G. in Berlin, began producing plants for cold metal spraying which required a complete sand-blasting of everything which needed metallizing.

Cerini's factory entrance - first years of 1900

Extraordinary photographic records of those years are available to show the high-tech level obtained and at the same time the variety of automatic and complex hardware machinery.

The METALLISATOR had been the only sand-blasting machinery producer until after the Second World War.

In 1939 the SIRSI began research work concerning a "pinch valve" based on lab tool known as "Hoffman's pincers".

At the end of the war, production, which had been slowed down, was resumed and the METALLISATOR began manufacturing turbine shot-blasting machines. The SIRSI, whose capital was entirely owned by the Cerini Family, resumed lab test research and launched on the market a new series of coupling-valves whose production started in the early 50s.

Since then the SIRSI turbine shot-blasting machines have strongly contributed to the development of this sector, consequently anticipating the times and outdoing all limits and restrictions.

They have reached the maximum in output, and in carrying capacity in tonnage, as well as being very efficient in handling items and covering square meters in a given time.

The SIRSI turbine shot-blasting machines are currently in operation all over the world.

King Vittorio Emanuele III with Doc. Leonardo Cerini visiting the company

Nowadays, the SIRSI valves are successfully utilized in Italy, and in all countries of the EEC, in Russia, along the Mediterranean Coasts of Africa and in the central mines, in the Middle East, in the South-East Asia and China. The SIRSI valves are famous for their endurance, durability and reliability in the harshest working conditions.

The first chairman and founder, Viscount Leonardo Cerini of Castagnate, ended his hardworking life as a businessman in October 1964 and his son Livio was appointed in his place.

Soon afterwards, the founder's grandson, with the same name Leonardo Cerini, actively began to run the company; today he is the Managing Director and General Manager.

SIRSI METALLISATOR

VALVOLE SIRSI A PINZA

La valvola, manuale o pneumatica, è a flusso rettilineo, senza premistoppa.

È costituita da un manicotto flessibile ed elastico, resistente alla corrosione e all'abrasione, solidale con la parte meccanica non soggetto a deformazioni permanenti.

Il manicotto compie un numero elevatissimo di aperture e chiusure in breve tempo.

Viene opportunamente scelto secondo i vari impieghi ed è disponibile in vari tipi di elastomeri: gomma Para, Para alimentare, Neoprene, EPDM, MNBR, Hypalon, Viton, Buna, Butile, Silicene.

Il meccanismo di chiusura è completamente protetto da ogni contaminazione di liquidi corrosivi ed esalazioni di ambiente.

SIRSI PINCH VALVES

Manual or pneumatic valves with straightway flux and no stuffing box.

Flexible and elastic sleeves.

Corrosion and abrasion resistant.

They become an integral part of the machine which is not subject to deformity.

The sleeve can execute an elevated number of openings and closing in a short time. They are a perfect choice for various uses and are available in a variety of types of rubber: natural Para rubber, pure, odourless rubber for the food industry, Neoprene, EPDM, MNBR, Hypalon, Buna, Butyl, Silicon.

Closing mechanism is completely contamination-free from corrosive liquids and environmental fumes.

Dimensioni flange: secondo norme UNI 2223 - PN 10-16 o DIN 2532 - ND 10. A richiesta secondo altre norme.

Scartamento tra le estremità delle flange: secondo norme DIN 3202 F1. A richiesta si possono fornire valvole con scartamenti minori (tipo "D").

Meccanismo di chiusura: a semplice effetto.

Corpo: alluminio o ghisa con protezione resistente alla corrosione previa sabbiatura.

Manicotto: gomma para od elastomeri sintetici (Neoprene, Butile, Hycar, Hypalon, Silicone, Viton).

Flange dimensions: to DIN 2532 - ND 10 or UNI 2223 - PN 10-16 standards. Optionally, according to different standards.

Length over flanges: to DIN 3202 F1 standards. Optionally shorter valves can be supplied (type "D").

Mechanism: single-acting.

Valve body: aluminum or cast iron, with corrosion-proof coating, after sandblasting.

Flexible sleeve: natural rubber or synthetic elastomers (Neoprene, Butyl, Hycar, Hypalon, Silicone, Viton).

Dimensions des brides: suivant les normes DIN 2532 - ND 10 ou UNI 2223 - PN 10-16. Sur demande, suivant autres normes.

Encombrement: longueur totale de bride à bride suivant normes DIN 3202 F1. Sur demande on peut fournir des vannes plus courtes (type "D").

Mécanisme de fermeture: à simple effet.

Corps de la vanne: en aluminium ou en fonte, avec protection anticorrosive après sablage.

Manchon: en caoutchouc naturel ou synthétique (Neoprene, Butyl, Hycar, Hypalon, Silicone, Viton).

Valvola costantemente aperta in posizione di riposo. Chiusura mediante immissione di aria compressa nel cilindro pneumatico.

Cilindro e pistone: in lega di alluminio.

Corpo: normalmente in alluminio.

Caratteristiche costruttive: come per i tipi "SD" (TN 2014) e "SC" (TN 2015).

Normally opened valve. Delivery of compressed air to the pneumatic cylinder closes the valve.

Cylinder and piston: aluminum alloy.

Valve body: normally aluminum.

Construction features: as per types "SD" (TN 2014) and "SC" (TN 2015).

Vanne normalmente ouverte. Fermeture de la vanne par admission d'air comprimé dans le cylindre pneumatique.

Cylindre et piston: en alliage en aluminium.

Corps de la vanne: normalement en aluminium.

Caractéristiques constructives: comme pour les types "SD" (TN 2014) et "SC" (TN 2015).

SIRSI METALLISATOR

VALVOLE A MEMBRANA FLAV FLUSSO AVVIATO

La valvola FLAV Sirsi, manuale o pneumatica, viene impiegata per intercettare fluidi aggressivi, fluidi difficili e fluidi sensibili che non ammettono premistoppa e non devono entrare in contatto con le parti meccaniche. La loro chiusura è affidata a una membrana elastica che viene spinta sino al corpo inferiore ottenendo una tenuta perfetta.

La membrana viene opportunamente scelta secondo i vari impieghi.

È disponibile in vari tipi di elastomeri: gomma Para, Para alimentare, Neoprene, EPDM, MNBR, Hypalon, Viton, Silicone, Butile, PTFE e Teflon.

I corpi sono disponibili in acciaio, ghisa, alluminio e con rivestimenti in gomma dura, teflon, ebanite.

Le valvole FLAV possono operare ad elevate temperature, pressione e sottovuoto.

SIRSI FLAV DIAPHRAGM VALVES SELF-STARTING FLUX

Manual or pneumatic Sirsi FLAV valves are used to intercept aggressive, difficult or sensitive fluids where a STAFFING BOX is not admissible and where contact with mechanical parts is not permitted.

The closing apparatus is controlled by an elastic diaphragm that is pushed into the lower body to obtain a perfect seal.

FLAV diaphragm valves have a wide variety of uses and are available in natural Para rubber, pure Para rubber for the food industry, Neoprene, EPDM, MNBR, Hypalon, Viton, Silicon, Butyl and Teflon.

Valve bodies are available in stainless steel, cast iron, aluminium and with hard rubber, Teflon or Ebonite coatings.

FLAV valves can be operated under high temperature, pressure or vacuum conditions.

250	395	1070	950	32	635	450	1/4" G	3	212,000	
300	445	1300	1150	32	749	450	1/4" G	3	242,000	

Valvola costantemente aperta in posizione di riposo. Chiusura mediante immissione di aria compressa nel cilindro pneumatico. Munita di volantino per chiusura manuale di emergenza.

Cilindro e pistone: in lega di alluminio.

Caratteristiche costruttive: identiche a quelle del tipo "FLAV" normale (TN 2028).

N.B.: le valvole FLAV-PCV vengono fornite con scartamenti DIN (cfr. TN 2028/A), con attacchi filettati (cfr. TN 2028/B) e con corpo a squadra (cfr. TN 2028/C).

Normally open valve. Delivery of compressed air to the pneumatic cylinder closes the valve. With handwheel for emergency manual closing operation.

Cylinder and piston: aluminum alloy.

Constructions features: as per normal type "FLAV" (TN 2028).

N.B.: type "FLAV-PCV" valves are also supplied with DIN length over flanges (see TN 2028/A) with screwed ends (see TN 2028/B) and with angle body (see TN 2028/C).

Vanne normalmente ouverte. Fermeture de la vanne par admission d'air comprimé dans le cylindre pneumatico. Avec volant de secours pour la fermeture manuelle.

Cylindre et piston: en alliage en aluminium.

Caractéristiques constructives: identiques à celles du type "FLAV" normal (TN 2028).

N.B.: les vannes "FLAV-PFV" sont également fournies avec encombrements DIN (cfr. TN 2028/A) avec extrémités taraudées (cfr. TN 2028/B) et avec corps d'équerre (cfr. TN 2028/C).
